# Bachelor Thesis

## Meeting 3

Not a rule but suggested.
Directly affects a graded criterion.

# General tips: Introduction

- The goal of an introduction is to provide background for your study. That means that you have to:
  - Introduce all variables
  - Elaborate on previously found relations between these variables (all relations you are testing)

Refer to findings not **design of cited studies – these are empty words, they prevent you from expanding in scope and depth**

- Design is only relevant if your study benefits from this information
  - i.e., if your study adds to scientific knowledge through its design, not findings (maybe you have a new questionnaire, task, ...)

Not a rule but suggested.
Directly affects a graded criterion.

# General tips: Introduction

- Cite more!
  - Not more instances of names in brackets
  - But more references to relevant literature

Beliefs matter. Our beliefs can comfort us, provide us with meaning, or tie us more closely to others (Heine, Proulx, & Vohs, 2006; Hogg & Mulling, 1999; Lerner & Miller, 1978). Authors such as Durkheim and Freud famously argued that religious belief plays such a role in the lives of believers. Recent research has provided evidence for this view, showing that religious belief can compensate for lack of control (Kay, Whitson, Gaucher, & Galinsky, 2009), alleviate anxiety (Inzlicht, Tullett, & Good, 2011; Norenzayan & Hansen, 2006), and relieve stress (Ano & Vasconcelles, 2004). What remains unclear, however, is whether these compensatory effects of religious belief are driven by its supernatural or transcendent content, or whether these effects instead stem from belief more generally. Accordingly, the aim of the present research was

*from the assessment criteria for the thesis*

"provides an **up-to-date** review of the scientific literature relevant for the current study, which is adequate in **scope and depth**"

**up-to-date** – review is incomplete if there is a lack of recent, and relative information
**scope** – all relevant concepts are described
**depth** – citing one study is not enough, you should cite (if possible) all relevant studies to provide a complete overview

No more feedback will be provided on points raised here
However, that does not mean that you meet the style expectations and criteria.
Use the shared information freely to improve your writing.

Not a rule but suggested.
Directly affects a graded criterion.

# General tips: Methods

- Do not forget to include information about ethical considerations
  - See here

More feedback will be provided after you send in the full draft. We can also discuss your improvements during one of the meetings.

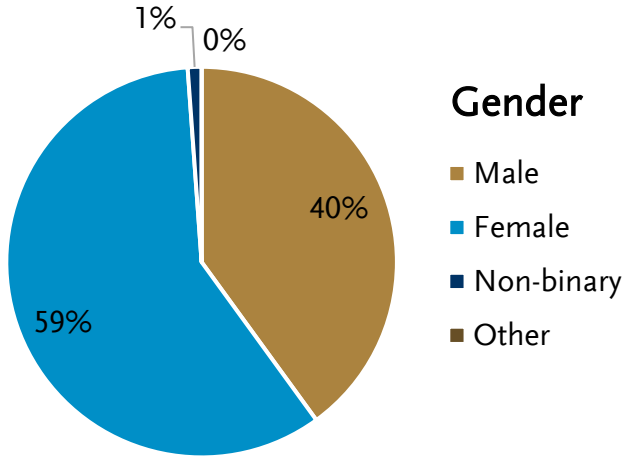

# Data collection

**Final sample: 175**

238 people started the study; 175 people completed all relevant measures (for each of your RQs!)

**Good job everyone!!!**

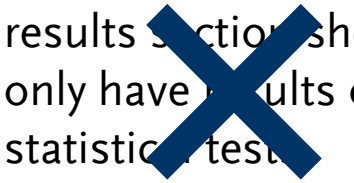

**Median duration:** 23.82 min
**Average duration (includes time off-survey for those that started and returned to it later):** 45.04 min

Average age: 39.11

Not a rule but suggested.

# Results

You should **not** talk about whether results support hypotheses, or what this support/lack of support means

**BUT**

You can say: “Individuals that reported higher trust in science were also more educated (F..., p...)”

*It is not wrong to only talk about concept using variables, but it is usually less understandable.*

Not a rule but suggested.
Directly affects a graded criterion.

# Reporting descriptive statistics

Most of the time, this can be part of a methods section

However, it might be better to include it as a first subsection of your results section. This is because the descriptive statistics are a **criterion of the results section** in the assessment sheet.

Consider making a table that summarizes descriptive stats (means, SDs, correlations...) of all relevant measures. The descriptives for the sample (age, gender) can stay in methods.

# Discussion

- To **remind** of important results

> Our results provide evidence that blocking mobile internet from smartphones for 2 weeks can produce significant improvements for SWB, mental health, and the objectively measured ability to sustain attention. Even those who did not fully comply with the

- To **interpret** results (in relation to hypotheses)

> This Registered Report investigated differences in trust in scientists between liberals and conservatives and tested interventions to increase conservatives' trust in scientists. Although levels of trust in scientists were relatively high, we found that liberals (compared with conservatives) indicated higher trust across all 35 scientific occupations we investigated, supporting H1. This relationship between political ideology and trust varied across different occupations such that differences in trust were particularly pronounced for certain scientists (for

- To state **implications**

# Abstract

Write as a last step!

**Abstract**
This paper presents and assesses a framework for an engineering capstone design program. We explain how student preparation, project selection, and instructor mentorship are the three key elements that must be addressed before the capstone experience is ready for the students. Next, we describe a way to administer and execute the capstone design experience including design workshops and lead engineers. We describe the importance in assessing the capstone design experience and report recent assessment results of our framework. We comment specifically on what students thought were the most important aspects of their experience in engineering capstone design and provide quantitative insight into what parts of the framework are most important.

Not enough words – has to be between 150-250

We cannot understand it on its own (unclear what the framework is) – has to be understood on its own

No RQ – should be stated

No information about participants, variables, methodology – but mandatory

No summary of findings, answer to RQ, implications – but mandatory

# Upcoming

| | |
|---|---|
| Next Week | **Receiving data sets.** Each of you will get your own data set with demographic variables + variables of questionnaires relevant for your analysis. |
| By November 15th at 23:59 | **OPTIONAL.** If you would like to receive feedback on your analysis plan* before starting analyses, you can send it next week. |
| December 7 at 21:00 | Submit results together with SPSS syntax. |

* This includes an outline of your results section (e.g., where you plan to include each analysis, which analyses you plan to run, how you want to present results,...), the planned outlier exclusion criteria, how you plan to recode data, how you plan to deal with missing values, which visualizations you will include...

**It is perfectly fine if you do not want to send this, however, by sending this you are lowering your risk of having to re-analyse data and/or having to rewrite the entire section.**
